

Lab Results & Imaging Integration Guide

Setup process, responsibilities, and integration scope

Document date: 22 May 2026

This guide explains how Laboratory (Lab Results) and Medical Imaging work in Cura today, who is responsible for setup and operations, and how full external system integration (LIS / PACS / HL7) differs from the standard in-platform workflow.

Contents

1. Lab Results Integration

1.1 What it means in Cura today

Lab management in Cura is primarily an in-platform clinical workflow, not an automatic feed from an external Laboratory Information System (LIS). The product supports:

- Ordering lab tests from the Lab Results module (doctor, nurse, lab technician, admin, and other clinical roles).
- Status tracking through the lab lifecycle (e.g. pending !' results entered !' r
- Manual result entry and PDF generation for formal lab reports.
- File storage for lab request and result documents (organization/patient folder structure).
- Billing: lab test catalog and charges under Finance !' Billing !' Lab Tests pr
- Access control via User Management roles and module permissions.

Contract and roadmap materials describe HL7 and LIS automation (auto-import, critical values, trending). The Integrations screen lists “HL7, FHIR, Labs” as a clinical category. Working self-serve connectors today include Stripe, Twilio, QuickBooks, and NHS Digital—not a dedicated live LIS connector. Treat automated LIS as a custom integration project unless explicitly delivered.

1.2 Setup process (typical go-live)

Phase	Who	What happens
1. Tenant & access	Client (admin)	Create users and roles; grant Lab Results module access to lab_technician and ordering clinicians.
2. Service catalog	Client (finance/admin)	Configure tests and fees: Billing !' Lab Tests (name, code, p
3. Documents	Client (admin)	Configure header/footer templates for branded lab PDFs.
4. Operations	Client (clinical + lab)	Clinicians order tests; lab staff enter results and distribute PDFs.
5. External LIS	Client + Cura	Optional: HL7/LIS auto-import—requires joint integration project.

Cura’s user manual lists four go-live prerequisites for all clinics: roles, shifts, fees/charges, and PDF header/footer. Lab setup aligns with fees (lab test catalog) and operational use of the Lab Results module.

1.3 Client responsibility

- Define lab test menu and pricing in Billing !' Lab Tests .
- Assign staff roles and permissions (order vs enter vs approve vs view-only).
- Run day-to-day workflow inside Cura (orders, results, patient communication).
- For HL7/LIS projects: provide vendor specs, code mapping, network/firewall access, test data, and clinical UAT sign-off.
- Maintain data quality: correct patient identity, NHS numbers, and order-to-result matching.

1.4 Cura responsibility

- Host multi-tenant application, APIs, database, and secure file storage.
- Provide Lab Results UI, workflows, PDF tooling, and billing linkage.
- Enforce role-based access and organization data isolation.
- For contracted LIS/HL7 work: design interfaces, mapping, deployment, and support (project-based).

1.5 External LIS integration (optional / custom)

Target capabilities from product specifications:

- HL7 (or equivalent) for automated result import and patient/order matching.
- Critical value alerts, historical trending, and provider review workflows.

Shared responsibilities for a LIS integration project:

Area	Client	Cura
Vendor & connectivity	Select LIS; firewall, VPN, certificates	Build and configure interface
Code mapping	Map local panels to Cura catalog	Import and matching logic
Testing	Realistic orders and results	Development and staging validation
Go-live	Clinical sign-off	Monitoring and incident response

2. Imaging Integration

2.1 What it means in Cura today

Imaging in Cura is primarily an in-platform radiology workflow: order studies, upload image files, and complete radiology reports. Supported today:

- Imaging study orders (patient, provider, study type, clinical indication).
- File upload including DICOM MIME types; storage under organization upload paths.
- Radiology reporting with structured fields and status workflow.
- Imaging service catalog and charges: Billing ! Imaging / Radiology setup.
- Role-based access for ordering vs reporting vs administration.

Specifications mention PACS integration, DICOM viewing, and AI-assisted analysis. Current product focus is orders, uploads, and in-app reporting—not a full embedded PACS viewer or automatic modality routing. “Imaging Integration” in proposals should distinguish in-platform workflow vs optional PACS connectivity.

2.2 Setup process (typical go-live)

Phase	Who	What happens
1. Tenant & access	Client (admin)	Roles for ordering and reporting; Imaging module permissions.
2. Study catalog	Client (finance/admin)	Billing ! Imaging: X-Ray, MRI, Ultrasound, etc., w
3. Study types in UI	Client (admin)	Imaging module uses imaging_pricing for order dropdowns.
4. Documents	Client (admin)	Header/footer for radiology PDFs where applicable.
5. Operations	Client (clinical + radiology)	Order studies, upload images, complete reports.
6. External PACS	Client + Cura	Optional: DICOM routing from PACS—custom project.

2.3 Client responsibility

- Configure imaging services and standard charges in Billing.
- Define clinical workflow: who orders studies vs who signs reports.
- Upload and manage studies in the Imaging module (or delegate to radiology staff).
- For PACS: provide vendor, DICOM AE titles, routing rules, network, and acceptance testing.
- Govern retention, access, and UK GDPR/clinical policies for diagnostic images.

2.4 Cura responsibility

- Platform hosting, imaging APIs, and secure file handling.
- Order-to-report workflow linked to patients and billing catalog.
- PDF/report features where implemented in the Imaging module.
- Custom PACS/DICOM integration when contracted (worklist, C-STORE, viewer—project-based).

2.5 External PACS integration (optional / custom)

Target capabilities from specifications:

- DICOM compliance, secure transmission, web-based viewing, worklist from orders.

Shared responsibilities for PACS integration:

Area	Client	Cura
PACS & network	Own PACS; VPN and certificates	Integration architecture and build
Modality routing	PACS admin configuration	Receive, store, display pipeline
Workflow	Clinical standards for reporting	Order !" study association
Testing	Real DICOM studies and edge cases	Performance and validation

3. Comparison summary

Topic	In Cura today	Full external integration
Lab	Order !' enter results !' P D F	HL7 auto-import from LIS
Imaging	Order !' upload !' report !' b	PACS DICOM push/pull + viewer
Setup owner	Client admin, finance, clinical	Client IT + vendor + Cura engineering
Integrations page	Stripe, SMS, NHS, etc.	Clinical/HL7 is category; lab/PACS is custom

4. Recommendations for proposals & contracts

Standard package (default)

Describe client setup (roles, billing catalog for lab tests and imaging, PDF branding) and Cura platform delivery (modules, workflows, permissions, storage). Do not assume external LIS or PACS on day one.

Enhanced package (add-on)

Document LIS (HL7) and PACS (DICOM) as separate implementation work: client provides vendor access, mapping, and testing; Cura delivers interface development, deployment, and support.
