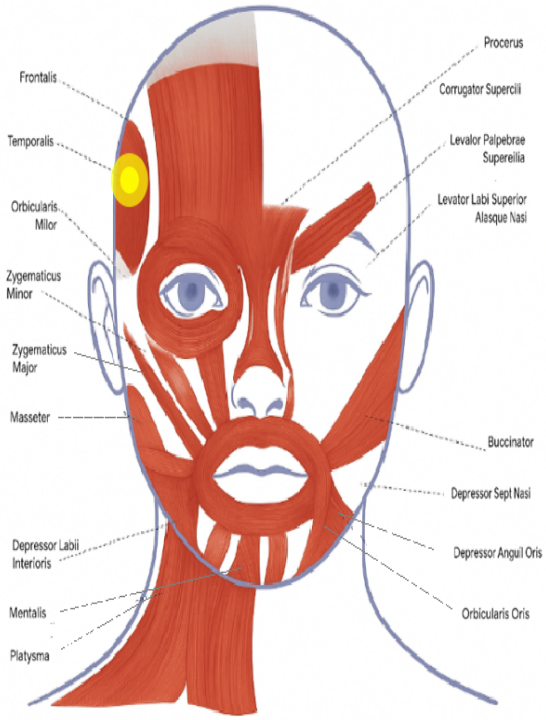
Professional Anatomical Treatment Plan

Analysis Details:

Target Muscle Group: Temporalis
Analysis Type: hyperactivity
Primary Treatment: Facial Exercise
Treatment Intensity: moderate
Session Frequency: twice_weekly
Primary symptoms: eye_strain
Severity Scale: 6
Follow-up Plan: 3_months



PROFESSIONAL ANATOMICAL TREATMENT PLAN

Target Area: TEMPORALIS
Analysis Type: hyperactivity
Primary Treatment: facial exercise

CLINICAL ASSESSMENT:
The patient presents with symptoms affecting the temporalis region. Based on the hyperactivity analysis, the following treatment protocol is recommended.

Primary Symptoms: eye_strain
Severity Rating: 6

TREATMENT PROTOCOL:
1. Initial Assessment
   - Comprehensive evaluation of temporalis function and condition
   - Baseline documentation with clinical photography
   - Patient history and contraindication screening

2. Primary Treatment: facial exercise
   - Treatment Intensity: moderate
   - Session Frequency: twice_weekly
   - Progressive monitoring of muscle response and patient tolerance
   - Adjustment of treatment parameters based on individual response

3. Monitoring and Follow-up
   - Regular assessment of treatment efficacy
   - Documentation of progressive improvements
   - 3_months

PATIENT EDUCATION:
- Expected timeline for visible results: 7-14 days
- Potential side effects and their management
- Post-treatment care instructions
- Activity restrictions and recommendations

SAFETY CONSIDERATIONS:
- Patient should be advised of all potential risks and contraindications
- Informed consent must be obtained prior to treatment
- Emergency protocols should be reviewed with patient
- Contact information for post-treatment concerns provided

This treatment plan should be reviewed and adjusted based on individual patient response and clinical judgment.
